Instruction Manual
Leica CM3050 S – Cryostat
English V1.1 – 02/2000
Always keep this manual near the instrument.
Read carefully prior to operating the instrument.
Important note

The information contained in this document represents state-of-the-art technology as well as the current state of knowledge.

Leica will not assume liability for errors that might be contained in this manual, nor for accidental damage or damage arising from the delivery, performance or use of this manual.

Therefore, no claims can be made based on the text and illustrations in this instruction manual.

Leica Microsystems Nussloch GmbH reserves the right to change technical specifications without notice since each of our products is subject to a policy of continuous improvement.

This document is protected under copyright laws. Leica Microsystems Nussloch GmbH retains all rights related to this documentation. Any reproduction of text and illustrations - or any parts thereof - in form of printing, photocopying, microfiches, or other methods, including electronic systems, requires the prior written permission of Leica Microsystems Nussloch GmbH.

The serial number and the year of manufacture are specified on the nameplate at the back of the instrument.

The chapters of the Leica CM3050 S cryostat instruction manual:

Chapter 1  Structure of the manual:
  • Table of contents
  • Important information on this manual

Chapter 2  Safety
  • Read this chapter before operating the instrument!

Chapter 3  Installation
  • Unpacking and installation
  • Standard delivery, information on accessories

Chapter 4  Instrument properties
  • Overview
  • Technical data

Chapter 5  Operation
  • Controls
  • Setup, daily use and shut down

Chapter 6  Trouble shooting and applications tips
  • Operating errors
  • Display error messages
  • Temperature reference chart

Chapter 7  Disinfection, cleaning and maintenance

Chapter 8  Warranty and service

Appendix  Electrohydraulic height adjustment
          Ordering information accessories
          EC Declaration of Conformity
          Alphabetical index

1. Important information

1.1 Symbols used in this manual and their meaning

Warnings appear in a grey box and are marked by a warning triangle ⚠️.

Notes i.e. important user information appears in a grey box and is marked by an information ✉️ symbol.

Figures in brackets refer to item numbers in drawings or to the drawings themselves.

Instrument type:
All information given in this instruction manual applies only to the instrument type indicated on the title page.

A name plate, indicating the instrument serial number, is attached to the back of the instru-
mement.

Required information for all inquiries:
For any inquiries please specify:
  • Instrument type
  • Serial number
1. Important information

General

This instruction manual includes important instructions and information related to the operating safety and maintenance of the instrument. The instruction manual is an important part of the product. It must be read carefully before using the instrument for the first time and must always be kept with the instrument.

If additional requirements, which exceed the scope of this manual, are imposed by regulations and/or laws on accident prevention and environmental protection in the country of operation, appropriate instructions for compliance with such requirements must be added to this manual.

Read this instruction manual carefully before attempting to use or operate the instrument.

1.2 Designated use

The Leica CM3050 S is a powerful cryostat for routine as well as research applications in biology, medicine and industry.

The instrument has been designed for rapid freezing and sectioning of tissue samples.

The instrument has not been designed for unattended storage of tissue material.

The instrument may only be operated within the scope of its designated use as described above and as per the instructions given in this manual.

Any other use of the instrument is considered improper.

1.3 Qualification of personnel

The Leica CM3050 S may only be operated by trained laboratory personnel.

All laboratory personnel designated to operate the instrument must carefully read the present instruction manual prior to starting work with the instrument.

Please pay particular attention to chapter 2 (safety features, safety instructions). - Please read this information, even if you are already familiar with the operation and use of other Leica products.
2.1 General information on instrument design and safe handling

This instrument has been built and tested in accordance with the following safety regulations on electrical measuring, control, regulating and laboratory devices:

- DIN EN 292
- DIN EN 61010-1
- EN 50082-1
- EN 55011
- IEC 1000-4

as well as according to the international quality standard

- DIN ISO 9001

In order to maintain this condition and to ensure safe operation, the operator must observe the instructions and warnings contained in this instruction manual.

2.2 Integrated safety devices

The instrument is equipped with the following safety devices:

- Handwheel lock
- Handwheel grip centering
- Emergency stop function (instruments with sectioning motor only)
- Knife holder equipped with knife guard

The safety devices installed by the manufacturer of the instrument only constitute the basis of accident prevention.

Mainly responsible for accident-free operation is above all the institution which owns the instrument and, in addition, the designated personnel who operate, service or repair the instrument.
2. Safety

2.2.1 Locking the handwheel

Always cover the cutting edge with the knife guard and lock the handwheel:
- Prior to doing any work on knife and/or specimen.
- Prior to exchanging specimens.
- During work breaks.

The handwheel can be locked in 2 positions:
- with the grip in the uppermost position (left),
- with the grip in the lowest position (right).

![Diagram of handwheel locking mechanism]

**Locking:**
- Rotate handwheel, until grip (1) is in upper or lower position.
- To lock, press pin (2) to the right into position (2b).

--- The upper locking position for pin (2) is marked by a black dot (4).

**Instruments with sectioning motor:**
The sectioning motor is now blocked.

**All instruments:**
The message ‘LOCKED’ in the display of control panel 1 indicates that the handwheel has been locked:

```
  C  T - 3 0 °C  0  T - 3 5 °C

  LOCKED
```

**Unlocking:**
- To unlock, push locking pin (2) to the left into position (2a).
- Display indication ‘LOCKED’ disappears.

**Instruments with sectioning motor:**
The sectioning motor can now be activated again.

2.2.2 Centering the handwheel grip

**During motorized sectioning, for safety reasons always center the handwheel grip!**

- To center grip (1), pull outwards and pivot into center of handwheel.
- When released, the grip locks into position.
2.2.3 Emergency stop function (instruments with sectioning motor only)

The emergency stop is activated via the red emergency stop button in control panel 2 or via the footswitch.

Control panel 2

Footswitch

Activating the emergency stop function

- Press emergency stop button or step on footswitch forcefully.
  
  --> STOP (red) lights up.

As soon as the emergency stop function is activated, the sectioning motor stops.

Deactivating the emergency stop

- To deactivate, rotate emergency stop button in direction of arrow.

If the emergency stop function has been activated by the footswitch, unlocking is not necessary (function is unlocked as soon as the footswitch is released).

2.2.4 Knife guard

All knife holders are equipped with a knife guard (--> see separate instruction manuals on knife holders).

Always cover the cutting edge with the knife guard:

- Prior to doing any work on knife and/or specimen.
- Prior to exchanging specimens.
- During work breaks.
2.3 Safety instructions: handling and operation of the instrument

2.3.1 Transport

- To avoid severe damage to the instrument by running it while the compressor oil is displaced from its regular position:
  - Do not tilt the instrument, only transport in an upright position.
- After transport, wait at least 4 hours before turning the instrument on.
  --> The compressor oil may have been displaced during transport and must settle to its original position before switching the instrument on. Otherwise, the instrument may be severely damaged.

2.3.2 Site requirements

- Do not operate the instrument in rooms with explosion hazard.
- To ensure proper instrument function maintain a minimum distance of 10 cm between walls and/or furniture and all sides of the instrument!

2.3.3 Electrical connections

- Do not use extension cords for connecting the instrument to mains.
  --> Fire hazard!
  --> Instrument malfunctions caused by voltage drop.
- During the start-up phase of the compressor, the nominal voltage must not drop below the values specified in chapter 4.2 'Technical data'!
  --> The compressor needs a start-up current at between 25 and 35 A (see chapter 4.2 'Technical data')
- Ensure uniform current supply according to specifications.
  --> Electrical power supply deviating from specifications damages the instrument.
- Therefore, arrange for the electrical installations on site to be checked by a trained professional and make sure any necessary upgrades are installed!
- Have the circuit protected by a fuse of its own!
- Do not connect any other consumers to the same circuit.
- Prior to connecting the instrument to mains, make sure the electrical power supply in your laboratory corresponds to the values indicated on the instrument nameplate (located at the rear of the instrument)!
2.3.4 Handling microtome knives/blades

- **Danger!**
  - Microtome knives and disposable blades have extremely sharp cutting edges and can cause serious injuries. Therefore:
  - Handle knives / blades with utmost care.
  - Never leave any knives / blades in unprotected places!
  - Never place a knife, no matter where, with the cutting edge facing upwards.
  - Never try to catch a falling knife.
  - Always insert the specimen before inserting the knife.

2.3.5 Knife guard/handwheel lock

- Always cover the cutting edge with the knife guard and lock the handwheel:
  - Prior to doing any work on knife and / or specimen.
  - Prior to exchanging specimens.
  - During work breaks.

2.3.6 Motorized sectioning

- Do not interrupt sectioning / trimming by setting the sliding potentiometer to zero speed!
  - This does not really switch the sectioning function off - it only operates at ‘0’ speed.
  - If the sliding potentiometer is accidentally moved, the instrument will resume sectioning immediately (risk of injury)!
- During motorized sectioning, always center the handwheel grip!

2.3.7 Defrosting/Handling frozen tissue

- Never leave specimens unattended in the cryochamber over an extended period of time!
- In case of power failure or instrument failure, or during the automatic defrost cycle, tissue material can be destroyed.
- During the defrost cycle the cryochamber is partially warmed. Therefore:
  - Remove sensitive specimens from the chamber prior to defrosting.
  - If automatic defrosting is programmed to take place during the night, remember to remove all specimens from the cryochamber prior to leaving work.

2.3.8 Frozen parts of the instrument and frozen accessories

- Prolonged contact of bare skin to frozen surfaces of the instrument or to frozen accessories (specimen discs, knife holder, shelves etc.) can cause frostbite.
- Wear protective gloves.
2. Safety

2.3.9 Infectious/radioactive material

- **Danger!**
  Use caution when working with potentially infectious specimens:  
  --> Risk of infection!

- When working with potentially infectious / radioactive specimens:
  - Wear protective clothes (gloves, protective boots, mask, lab coat), in compliance with radiation safety regulations and/or in-house regulations on handling infectious / radioactive material.

- When working with radioactive specimens:
  - Comply with applicable radiation safety regulations!
  - Dispose of radioactive specimen waste according to applicable regulations.

2.3.10 Disinfection and cleaning

- Prior to disinfection, switch the instrument off and unplug it from mains.

- For removal of the microtome from the cryo-chamber see chapter 2.3.11 ’Removing the microtome’.

- For disinfection, wear protective gear: (gloves, mask, lab coat etc.)!

- For disinfection, only use alcohol-based disinfectants!

- Do not use solvents (xylene, acetone etc.) for cleaning or disinfection!

- Do not spray disinfectants into the evaporator!  
  --> Risk of icing!

- Explosion hazard when working with alcohol: Make sure the premises are appropriately ventilated!

- When using disinfectants and detergents, comply with all safety instructions supplied by the manufacturer of the product!

- Dispose of waste liquids from disinfection/cleaning as well as of sectioning waste according to applicable regulations on disposal of special category waste!

- Disinfected accessories must be thoroughly dry when reinserting them into the chamber!  
  --> Risk of icing!

- Make sure the chamber is completely dry before switching the instrument back on:  
  --> Explosion hazard through alcohol vapors!  
  --> Risk of icing!
2.3.11 Removing/reinstalling the microtome

- **Before removing the microtome:**
  - Switch instrument off.
  - Unplug from mains.
  - Place handwheel grip in lowest position and lock.
  - When removing the microtome, the specimen head must always be locked in the lowest position. Otherwise the upper part of the slot cover might be bent and consequently damaged!

- **When removing the microtome:**
  - Wear gloves when removing the microtome while it is still frozen.
  - Risk of frost bite!
  - On instruments with specimen cooling: do not distort the refrigerating tube! If distorted it might break, causing extremely cold refrigerant to escape.
  - Risk of frost bite!

- **Before reinstalling the microtome:**
  - Microtome must be completely dry.
  - Humidity in the interior of the microtome freezes and causes microtome malfunctions and/or damage to the microtome.
  - All accessories/tools removed from the cryochamber must be thoroughly dry before putting them back into the chamber!
  - Risk of icing!

2.3.12 Display message ‘Dry microtome’

- If the error message ‘Dry Microtome’ is displayed in control panel 1, the following has happened:
  - Cryochamber refrigeration has been interrupted for an extended period of time (e.g. power failure), causing the chamber temperature to rise into the positive digits.
  - If this message appears, do not switch on the instrument but remove the microtome from the chamber, disinfect, if necessary, and dry thoroughly before reinstalling it into the chamber (see chapter 7.1 to 7.5).

2.3.13 Maintenance

- Only technical service engineers authorized by Leica may access the internal components of the instrument for service and repair.
  - The fluorescent light lamp (chamber illumination), unless broken or splintered, can be replaced by the user:
    - Switch off mains switch!
    - Unplug the instrument from mains!
    - If the lamp is broken or splintered: Have lamp replaced by Leica Technical Service!
    - Risk of injury!
  - Use only those replacement lamps that correspond to technical specification (see chapter 4.2 ‘Technical Data’).
3. Installation

3.1 Site requirements

3.1.1 General site requirements

- No direct sunlight.
- Electrical power supply within distance (length of power cord = approx. 4 meters - do not use extension cords!).
- No draft (caused by air conditioning etc.).
- Even floor surface.
- Practically vibration-free floor.
- Handwheel easily accessible.
- Room temperature constantly below +22 °C.
- Relative humidity of air maximum 60 %.

3.1.2 Electrical connections

3.2 Unpacking and installation

Unpacking instructions are always located in a transparent protective envelope on the outside of the instrument shipping crate.

3.2.1 Repacking

We recommend to keep the original shipping crate and the unpacking instructions for the Leica CM3050 S.

For repacking, proceed as per unpacking instructions, in reverse order.

High ambient temperature and/or high air humidity negatively affect instrument cooling performance!
3.3 Standard delivery

Together with the Leica CM3050 S instrument you receive a box containing the following standard accessories:

1 Handwheel (including screw, spring washer and cover disc)
1 Heat extractor, stationary
1 Low-temperature stabilizer for heat extractor
3 Specimen discs, 30 mm Ø
1 Storage shelf, right
1 Storage shelf, left
1 Section waste tray
1 Rubber mat
1 Cover for quick-freeze shelf
2 Brushes (brush, fine and ‘Leica’ brush)
1 Shelf for brushes
1 Tool set
   - 1 Allen key, size 4
   - 1 Allen key, size 5
   - 1 Allen key, size 6
   - Single-ended open-jaw wrench
1 Bottle of embedding medium for cryosectioning, 125 ml
1 Bottle of cryostat oil No. 407, 100 ml
1 Instruction manual
   (German, English, French, Spanish)

In addition to the above:

Instruments with specimen cooling:
   1 90° Prism
      for low temperature quick freezing

Instruments with sectioning motor:
   1 Footswitch with protective guard

Configured instruments:
   1 Knife holder base
   1 Knife holder with accessories

Further accessories:

Further accessories which you ordered will be included in the box containing the standard delivery items.

Knife holders are delivered with anti-roll guide, knife guard, and a separate instruction manual.

In case of non-configured instruments, the knife holder is not a part of standard delivery but must be ordered separately.

- Check all delivered parts against the packing list and against your order to verify whether the delivery is complete! If there is any difference, contact your local Leica office immediately.

Available models

- Basic instrument
  - with sectioning motor
  - without specimen cooling

- Basic instrument
  - without sectioning motor
  - with specimen cooling

- Basic instrument
  - with sectioning motor
  - with specimen cooling
3. Installation

3.4 Installing/inserting accessories

3.4.1 Installing the handwheel

- Insert pin (1) of the handwheel shaft into hole (2).
- Place spring washer (3) onto screw (4) as shown.
- Tighten screw (4) with an Allen key.
- Cover with selfadhesive disc (5).

For purposes of transport (e.g. narrow doors), the handwheel can be removed.

- To remove the handwheel, proceed as described above but in reverse order.

3.4.2 Inserting the accessories

- Place the rubber mat on top of the housing.
- Insert the storage shelves into the cryo-chamber.
- Install the stationary heat extractor into the quick-freeze shelf (see also drawing in chapter 5.5.1 ‘Freezing specimens onto specimen discs’).
- Insert the low temperature stabilizer into the quick freeze shelf (it must be located in the pivoting range of the heat extractor - see also drawing in chapter 5.5.1 ‘Freezing specimens onto specimen discs’).
- Insert section waste tray and brush shelf.
- Install knife holder base onto microtome base plate and clamp.
- Install knife holder and clamp (see knife holder instruction manual for details).
- Place knife case with knife into chamber to precool.
- Place all tools needed for section preparation into the chamber.
- Close the sliding window.

For a complete overview of all individual parts:
--> see Chapter 4.1 ‘Overview’.
3.4.3 The footswitch

Function

The footswitch performs the same task as the RUN/STOP and RUN/ENABLE keys (activating/deactivating motorized sectioning / trimming). In addition, the footswitch can be used to activate the emergency stop function.

Models with footswitch:

All instruments with sectioning motor.

Connecting the footswitch

- Insert footswitch into port (1) and secure.

3.5 Prior to switching on the instrument

After transport, observe a waiting period of at least 4 hours before turning the instrument on! - See also safety instructions in chapter 2.3.1 ‘Transport’.

Have you observed all safety instructions in chapters 2.3.2 ‘Site requirements’ and 2.3.3 ‘Electrical connections’?

If not:

--> Please read chapters 2.3.2 and 2.3.3!

- Insert mains plug into wall outlet.
- Continue with chapter 5.1 ‘Setting up the instrument’.

Important note:

In all instrument models that are delivered with footswitch, the footswitch must be installed! - Otherwise the instruments are not functional.
**4. Instrument Properties**

**Microtome**
- Rotary microtome
- Section thickness setting: 0.5 - 300 μm
- Overall specimen feed: 25 mm
- Vertical stroke: 59 mm
- Specimen retraction: 50 μm
- Maximum specimen size: 40 x 55 mm
- Specimen orientation: 8° (x-, y-, z-axis)
- Trimming (6 thickness settings): 5 - 150 μm
- Motorized coarse feed:
  - slow: 500 μm/s
  - fast: 1,000 μm/s

**Fluorescent light lamp (cryochamber illumination):**
- 50 Hz version: Osram Dulux S 11 W/21
  - Light color ‘LUMILUX hellweiß’ (brilliant white)
- 60 Hz version: Osram Dulux S 13 W/21
  - Light color ‘LUMILUX hellweiß’ (brilliant white)

**Sectioning motor (Option):**
- Sectioning speed
  - slow
    - min.: 0.1 mm/s
    - max.: 100 mm/s
    - V_max: 210 mm/s
  - fast
    - min.: 0.1 mm/s
    - max.: 170 mm/s
    - V_max: 210 mm/s

**Cryocabinet**

**Dimensions**
- Width (w/o handwheel): 800 mm
- Width (including handwheel): 882 mm
- Depth: 766 mm
- Height (arm rest level): 840 mm
- Overall height: 1040 mm

**Weight**
- (incl. microtome, w/o specimen cooling): ca. 180 kg

① according to IEC-1010, UL 3101
② according to CECOMAF:
  - Liquid temperature 45°C
  - Evaporation temperature -25°C
5. Operation

5.1 Operating the instrument for the first time

Prior to setting up the instrument, make sure to read the instruction manual carefully and in full.

When setting up the instrument, please follow the individual chapters in the following order:

- First, study chapters 1, 2, and 3 - install the instrument as described in chapter 3.  
The overview in chapter 4.1 is helpful during the unpacking and installation procedure in order to identify individual parts and place them in the correct location.

- Go on to chapter 5.  
Read chapters 5.1, 5.2, 5.3 and 5.4 to learn all about the controls.

- Next, start to work with the instrument (chapter 5.5). Follow the instructions in chapter 5.5.  
Chapter 5.5.2 applies to instruments with specimen cooling only.  
The temperature chart in chapter 6.3 is useful when it comes to selecting appropriate sectioning temperatures for different types of specimens.

- When disinfecting / cleaning the instrument and/or removing / reinstalling the microtome, please follow the instructions in chapter 7.

- In case of problems and malfunctions, please refer to chapters 6.1 and 6.2. These chapters list the most common types of problems which many times have simple causes that can be eliminated by the actual user.  
If you find ‘Call Technical Service’ in the ‘Remedy’ column, please do so. Never try to solve these problems yourself!
5.2 Switching on/fuses

**Automatic cutout for sectioning motor:**

The instrument is equipped with an automatic cutout (2) for the sectioning motor.

If the sectioning motor is overloaded (e.g. when sectioning extremely hard specimens etc.) the automatic cutout (2) will be triggered.

To make the instrument functional again after the automatic cutout (2) has been triggered:
- Push automatic cutout (2) inwards until it locks into position.

**Switching on**

- To switch on the instrument, place switch (1) in upper lock-in position.

**Mains switch / automatic cutout for the instrument:**

In addition to its function as ON/OFF switch, switch (1) is also the automatic cutout for the instrument.

If the automatic cutout has been triggered (e.g. caused by overcurrent):
- Put switch (1) back in upper lock-in position.

---

Leica CM 3050 S – Cryostat
5. Operation

5.3 Control panel 1

5.3.1 Key functions in control panel 1

- **ON/OFF key for cryochamber illumination.**
- **To select the menu items for setting / changing instrument parameters.**
- **In the status indication, pressing the arrow keys displays the individual current parameters.**
- **In the menu, pressing the arrow keys changes set values.**
  As soon as a value is displayed, it is automatically stored.
- **Activates the manual defrost cycle (cryochamber).** This key is functional only when one of the menu items ‘SET TEMP CT ... °C’ or ‘SET TEMP OT ... °C’ (last one only applies to instruments with specimen cooling) has been selected first.
- **Lock / unlock key:**
  - Locks the display to protect against accidental changes of set parameters.
  - Activates / deactivates a number of functions.

5.3.2 Display functions in control panel 1

The display in control panel 1 combines several different functions:

1. **When switching the instrument on:**
   A series of standard indications is displayed, during which two basic parameters can be selected (with the arrow keys):
   - Language (of display indications)
   - Speed level of sectioning motor.
   See chapter 5.3.3 ‘Display indications when switching on’.

2. **Menu function (activated via menu key):**
   Via the menu key a number of parameters can be selected, then be activated /deactivated via the lock/unlock key and/or changed via the arrow keys.
   See chapter 5.3.4 ‘Menu functions: Setting parameters of refrigeration, time and preset counter’.

3. **Status indication function:**
   The actual status of selected parameters is indicated in the display screen.
   Some of those parameters are displayed automatically (e.g. sectioning stroke phase, coarse feed position, handwheel locked).
   Others can be displayed by pressing the arrow keys; e.g. selected section thickness, preset counter status etc.
   See chapter 5.3.5 ‘Status indication’ and chapter 5.3.6 ‘Displaying state of refrigeration, section thickness and counters’.

---

26
5.3.3 Display indications when switching on

**Meaning of indication:**

**Initialization phase 1**

---

**Initialization phase 2**

---

**Software version**

---

**Selected display language**

---

**Sectioning motor speed level ‘slow’/ (fast)**

---

**Operator activity:**

---

If this indication is displayed: Do not switch on the instrument!
Prior to switching on, both microtome and accessories must be completely dry!
Remove microtome/accessories, disinfect if applicable, then dry thoroughly and reinstall.
(---See chapters 7.1 - 7.5).

*) Indication in instruments with specimen cooling. Instruments without specimen cooling: only CT (centered) is displayed.
5. Operation

5.3.4 Menu functions:

setting parameters of refrigeration, time and preset counter

Once the instrument has gone through the initial sequence of indications, you can go on to the menu functions to select and/or change instrument parameters.

If display is locked:
Press key until display background lights up.

Next, press the menu key. With each key stroke the following parameters will be displayed (display sequence as listed):

1. Specimen temperature
   (in instruments with specimen cooling only)
   (-10 - 50 °C)

2. Cryochamber temperature
   (0 - 40 °C)

3. Selected number of sections - preset counter
   (ON/OFF and setting selection from 1 to 999)

4. Maximum specimen temperature
   (ON/OFF)

5. Real time
   (in 1-minute steps)

6. Defrost time (starting time of automatic cryochamber defrosting)
   (in 15-minute steps)

7. Duration of defrost cycle
   (cryochamber defrosting)
   (6 to 12 minutes duration)

Menu items 5 and 6 displayed on 24 hour clock.

1. Specimen temperature:
   (instruments with specimen cooling only)

   Press key until menu item ‘Set specimen temperature’ is displayed:

   Press key briefly.
   The line in the specimen temperature field is replaced by an asterisk.

   From this point on the refrigeration system is activated and the desired set temperature can be selected with one of the arrow keys.

   Press arrow key and release upon reaching the desired value.

Note on the arrow key function:
Each time one of the arrow keys is pressed briefly, the value displayed in the menu will be changed one step up or down.
If an arrow key is pressed and held, the value will change continually (auto-repeat function).
When holding the key, scrolling speed will increase after a while.
As soon as a value is displayed, it is at the same time automatically stored.
2. **Cryochamber temperature:**

Press key until menu item ‘Set chamber temperature’ is displayed:

---

Continue as described for specimen temperature.

3. **Preset counter**
   (instruments with sectioning motor only):

Press key until menu item ‘Preset counter’ is displayed:

<table>
<thead>
<tr>
<th>PRESET COUNTER</th>
</tr>
</thead>
<tbody>
<tr>
<td>d n - - - -</td>
</tr>
</tbody>
</table>

= Preset counter activated

<table>
<thead>
<tr>
<th>PRESET COUNTER</th>
</tr>
</thead>
<tbody>
<tr>
<td>d n 0 5 6</td>
</tr>
</tbody>
</table>

= Preset counter deactivated

**Preset counter function:**

The preset counter allows the user to carry out a predefined number of sections in the ‘Continuous stroke’ sectioning mode.

Once the preselected number of sections has been carried out (= section counter reading ‘0’), the specimen head will stop automatically in the lower limit position.

The reference value (i.e. the value from which the preset counter counts downward) can be selected in the corresponding menu item.

In order to be able to set a reference value, the preset counter function must be active.

If the preset counter is deactivated (see diagrams above), press to activate.

Now there are two options:

1. Increase or decrease the actual reference value by pressing or .
2. Press and simultaneously in order to reload the former reference value (‘0’ when setting up the instrument) and then press either or individually in order to select the desired reference value. Depending on where you start from and where you want to go, method 1 or method 2 is quicker (see examples).

**Example 1:**

Actual preset counter reading = 50
Former reference value = 300
New reference value of 65 to be selected.

Method 1 is most convenient:
- Increase from 50 to 65 by pressing .

**Example 2:**

Actual preset counter reading = 50
Former reference value = 300
New reference value of 320 to be selected.

Method 2 is most convenient:
- Press and simultaneously to reload old reference value (300):
  - Increase from 300 to 320 by pressing .

For further information on the preset counter, please refer to chapter 5.3.6, Item 4 ‘Preset counter’.
5. Operation

4. Quick-freezing at maximum specimen temperature* (instruments with specimen cooling only)

Press key until menu item ‘Fast object freezing’ is displayed:

<table>
<thead>
<tr>
<th>Fast Obj Freezing</th>
</tr>
</thead>
<tbody>
<tr>
<td>On</td>
</tr>
<tr>
<td>Off</td>
</tr>
</tbody>
</table>

Press lock/unlock key to activate or deactivate (ON/OFF).

5. Real time

Press key until menu item ‘Time’ is displayed:

<table>
<thead>
<tr>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>10:23</td>
</tr>
</tbody>
</table>

- Use arrow keys (↑ or ↓) to set real time. Setting minutes as well as hours in 1-minute steps. Holding arrow button increases scrolling speed!

6. Starting time of automatic defrost cycle:

Press key until menu item ‘Defrost time’ is displayed:

<table>
<thead>
<tr>
<th>Defrost Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>4:30</td>
</tr>
</tbody>
</table>

(Time on display = start time of defrost cycle)

- Use arrow keys (↑ or ↓) to select the desired defrost start time.

The automatic defrost cycle takes place once every 24 hours at the selected defrost time.

7. Duration of defrost cycle:

Press key until menu item ‘Defrost period’ is displayed:

<table>
<thead>
<tr>
<th>Defrost Period</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chamber: 08 Min</td>
</tr>
</tbody>
</table>

- Use defrost keys (↑ or ↓) to adjust defrost time. (Only if necessary - see below).

Important information for setting the defrost parameters

Starting time of defrost cycle:
We recommend to program the automatic defrost cycle for a time outside regular working hours as a period of 4 hours should pass after the defrost cycle before work with the instrument is resumed (see also chapter 5.7.1 ‘Automatic chamber defrost cycle’).

Defrost cycle duration:
The duration of the chamber defrost cycle is set to 8 minutes in factory. This setting should only be changed, if the evaporator is not completely de-iced during the 8-minute cycle. In such cases, increase the defrost cycle duration gradually until the evaporator is ice-free after defrosting. The selected defrost cycle duration is valid for both automatic and manual chamber defrost cycle.

*) with 90° prism - see also chapter 5.5.2.
5.3.5 Status display

Each individual parameter is displayed in a certain area of the display screen.

**Upper line:**
In the menu (see chapter 5.3.4): indication of selected menu item.
Standard indication: Chamber temperature (instruments with specimen cooling: chamber and specimen temperature)

<table>
<thead>
<tr>
<th>CT - 30 °C</th>
<th>OT - 35 °C</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOME</td>
<td>*</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Upper line</th>
<th>Lower line</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16</td>
<td>1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16</td>
</tr>
</tbody>
</table>

**Digits 1 and 2**
Indicate sectioning stroke position:
- Sectioning stroke (outside sectioning window)
- Retraction stroke
- Sectioning stroke (inside sectioning window)

**Digits 3 - 6**
Indicate coarse feed position:
- Rear limit position: HOME
- Front limit position: STOP

**Indication of ‘malfunction’ or ‘handwheel locked’**:
- Micromtome plug loose, implausible values etc.: ????
- Handwheel is locked: LOCKED

Indication ‘LOCKED’ completely overlays digits 3 through 16, i.e. while ‘LOCKED’ is displayed, no other parameters will be displayed in digits 3 - 16 of the lower line.
- Further indications: see chapter 6.1 ‘Error messages indicated in the display screen’

**Digits 7 - 16**
Indicate the following parameters:
- Refrigeration status:
  Digit 15 = cryochamber
  Digit 16 = specimen
  Meaning of refrigeration symbols:
  - Refrigeration OFF
  - Refrigeration ON
  - Defrosting active
- Section thickness (set value)
- Section counter (actual value)
- Indication of total section thickness (actual value)
- Preset counter

**Digits 7 - 16:**
Scroll via arrow buttons to display individual parameters
5.3.6 Indication of refrigeration state, section thickness setting and counters

These parameters can be displayed via the arrow keys.
When pressing ↖, the parameters are displayed in the sequence listed on this page; when pressing →, they are displayed in reverse order. The display can be scrolled continuously, i.e. after the last parameter the display will automatically start again with the first.

1. Refrigeration state

<table>
<thead>
<tr>
<th>CT - 30 °C</th>
<th>OT - 35 °C</th>
</tr>
</thead>
</table>

Meaning of the refrigeration symbols (asterisks):
--> see chapter 5.3.5 ‘Status indication’.

2. Section thickness

<table>
<thead>
<tr>
<th>CT - 30 °C</th>
<th>OT - 35 °C</th>
</tr>
</thead>
</table>

The sectioning thickness is set with the + or - key (see chapter 5.4.7 ‘Setting the section thickness’).

3. Section counter

<table>
<thead>
<tr>
<th>CT - 30 °C</th>
<th>OT - 35 °C</th>
</tr>
</thead>
</table>

Once displayed (via arrow keys), the section counter can be set to ‘0’ at any time.
- To set to ‘0’ press \[\text{\textbf{\textit{<}}}\].

If the section counter is not set to ‘0’ by the user at some point, sections are counted up to ‘999’ at which point the counter automatically switches back to ‘0’.

4. Total section thickness counter

<table>
<thead>
<tr>
<th>CT - 30 °C</th>
<th>OT - 35 °C</th>
</tr>
</thead>
</table>

Can also be set to ‘0’ at any time (via \[\text{\textbf{\textit{<}}}\] key).
If the total section thickness indication is not set to ‘0’ manually, the instrument counts up to maximum 9999.5 μm at which point the counter will automatically switch back to ‘0’.
This indication shows the total thickness of all sections carried out since the counter was last set to ‘0’. (All sections, in sectioning and trimming mode, are counted).

5. Preset counter

| CT - 30 °C | OT - 35 °C | d n 0 5 6 |

Setting preset counter to ‘0’:
Press \[\text{\textbf{\textit{<}}}\] key.
\[\text{\textbf{\textit{<}}}\] can also be pressed while the continuous sectioning mode is in motion; in this case the preset counter is set to ‘0’ and sectioning stops upon reaching the lower limit position.
After it has been set to ‘0’, the preset counter is inactive.

Reloading the former reference value:
Press ↖ and ↓ simultaneously.
Reloading the former reference value is possible also while the continuous sectioning mode is in motion:
Upon pressing both arrow keys, the instrument continues sectioning without interruption, starting to count down from the old reference value.
5.4 Control panel 2

Instruments without sectioning motor

In instruments without sectioning motor, control panel 2 only consists of functional area B (see below).

Functional area B:
- Coarse feed
- Trimming
- Section thickness selection

Instruments with sectioning motor

In instruments with sectioning motor, the control panel is equipped with three functional areas: A, B and C (see large diagram).

A

Functional area A:
- Sectioning modes
- Sectioning window
- Sectioning speed
- Emergency stop function

B

Functional area B:
- Coarse feed
- Trimming
- Section thickness selection

C

Functional area C:
- Start / Stop sectioning
5. Operation

Functional areas A and C - Instruments with sectioning motor only

5.4.1 Selecting a sectioning mode / start and stop sectioning

Three different sectioning modes can be selected for motorized sectioning:

Sectioning mode 1 - Intermittent stroke:
The specimen head travels up and down as long as the RUN/STOP and RUN/ENABLE keys are pressed simultaneously or as long as the footswitch is depressed.

Sectioning mode 2 - Continuous stroke:
The specimen head travels up and down until it is stopped by pressing RUN/STOP or RUN/ENABLE or by depressing the footswitch.

Sectioning mode 3 - Single stroke:
The specimen head carries out one sectioning stroke and then stops in the lower limit position.

Activating a sectioning mode

Press one of the three sectioning mode keys described above. While a sectioning mode is active, the LED in the corresponding key will be illuminated.

Start / stop motorized sectioning

Sectioning mode 1 - Intermittent stroke:
- Simultaneously press and hold RUN/STOP and RUN/ENABLE, or depress and hold footswitch.
- To stop the sectioning stroke, release the keys or the footswitch:
The specimen head stops immediately.

Sectioning mode 2 - Continuous stroke:
- Simultaneously press and release RUN/STOP and RUN/ENABLE, or depress and release footswitch.
- To stop sectioning:
Press and release RUN/STOP or RUN/ENABLE or depress and release the footswitch:
The specimen head stops upon reaching the lower limit position.

Sectioning mode 3 - Single stroke:
- Simultaneously press and release RUN/STOP and RUN/ENABLE, or depress and release footswitch.
- The instrument carries out one complete section / retraction stroke and the specimen head stops upon reaching the lower limit position.

While sectioning is in motion, LED ‘RUN’ is illuminated.
While the sectioning motor is deactivated, LED ‘STOP’ is illuminated.
Both LEDs are located in functional area C.
5. Operation

Functional areas A and C - Instruments with sectioning motor only

5.4.2 Setting the sectioning window

The term ‘Sectioning window’ stands for a different (slower) speed setting in that part of the sectioning stroke where the specimen is actually cut, while the remaining sectioning stroke (above and below the specimen) as well as the retraction (return) stroke are carried out at a higher speed level (time-saving feature).

If a sectioning window is set, speed inside the window is as set on the control panel. Outside the sectioning window the specimen head travels at a proportionately higher speed.

- Position lower edge of specimen approx. 3 mm above the knife edge (rotate hand-wheel clockwise).

Press sectioning window key.

- Position upper edge of specimen just below the knife edge (continue to rotate the hand-wheel clockwise).

Press sectioning window key once more.

The value has been stored when the LED in the sectioning window key lights up briefly.

If the LED flashes, the value has not yet been stored, because the user has tried to set a window margin outside the possible window range (the area in which the sectioning window can be set is slightly smaller than the total section stroke).

- In that case, repeat the step in question.

The sectioning window cannot be deleted. If need be, it can be set to maximum size (i.e. almost the entire sectioning stroke will be carried out at one and the same speed).

Every time after the instrument is disconnected from mains, the sectioning window is set to maximum size upon switching back on. This also applies when the instrument is switched on for the first time.
5. Operation

Functional areas A and C - Instruments with sectioning motor only

5.4.3 Selecting sectioning speed

- Sectioning speed is selected via the sliding potentiometer. Speed can be changed while sectioning is in motion.

Caution when working in continuous mode:

If the slider is set to ‘0’, the sectioning motion stops, however, the actual sectioning mode is still active - just operating at ‘0’ speed.

If the slider is accidentally moved, sectioning will be resumed! - Risk of injury!

Therefore:

Do not interrupt sectioning / trimming by setting the sliding potentiometer to zero speed!
See also safety instruction in Chapter 2.3.6 'Motorized sectioning'.

Vmax key

As long as the button is pressed, the sectioning motion is carried out at maximum speed (210 mm/s).

While Vmax is active, the sectioning window is inactive.

When the Vmax key is released, the sectioning window becomes active again.

5.4.4 Emergency stop

- Activate by:
  - either pressing the emergency stop button forcefully (must lock in position),
  - or depressing the footswitch forcefully.

Either way, sectioning is interrupted at once.

In both cases, the red STOP LED in functional area A lights up, indicating that the emergency stop function has been activated. Simultaneously all 3 sectioning modes are deactivated (= all 3 LEDs off).

- To deactivate the emergency stop function, rotate the button in the direction of the arrow until it unlocks and slips upward into its original position.

As soon as the emergency stop button has been unlocked, the red STOP LED is extinguished.

- If the emergency stop function has been activated with the footswitch, unlocking is not necessary.

As soon as the footswitch is released, the red STOP LED is extinguished.

- To continue work, select one of sectioning modes 1 - 3 and restart the sectioning motion.

See also chapter 2.2.3 ‘Safety - Emergency stop function’ for further information on the emergency stop.
5. Operation

Functional area B - all models

5.4.5 Coarse feed keys

The four coarse feed keys in functional area B function as follows:

Coarse feed ‘fast backward’
- Travelling speed 1,000 µm/s

- Press key to activate.
  Specimen head travels backward (= away from knife):
  a. until it reaches the rear limit position,
  b. until it is stopped by pressing one of the coarse feed keys (to stop the function, any of the four coarse feed keys can be pressed).

Coarse feed ‘slow backward’
- Travelling speed 500 µm/s

- To start, press and hold.
  Specimen head travels backward (= away from knife) as long as the key is held.

Coarse feed ‘fast forward’
- Travelling speed 1,000 µm/s

- To activate the function, press and hold. The specimen head travels forward (= towards the knife) as long as the key is held.

Coarse feed ‘slow forward’
- Travelling speed 500 µm/s

- To activate the function, press and hold. The specimen head travels forward (= towards the knife) as long as the key is held.

‘STOP’-LED (located in key ‘Coarse feed fast forward’)

As long as the forward coarse feed (both fast and slow) is in motion, the ‘STOP’ LED is illuminated.

Upon reaching the front limit position, the ‘STOP’ LED starts flashing and the display in control panel 1 reads ‘STOP’.

LED ‘HOME’ (located in key ‘Coarse feed fast backward’)

As long as the backward coarse feed (both fast and slow) is in motion, the ‘HOME’ LED is illuminated.

Upon reaching the rear limit position, the ‘HOME’ LED starts flashing and the display in control panel 1 reads ‘HOME’.
5. **Operation**

**Functional area B - all models**

5.4.6 **Trimming and sectioning functions**

*Switching between trimming and sectioning*

Press this key to alternate between the two functions.

- **Trimmed illuminated:** Trimming mode is active.
- **Trimmed off:** Sectioning mode is active.

**Selecting trimming thickness**

- Activate trimming mode
- Select trimming thickness (= sectioning thickness at which trimming is carried out) by pressing [+] or [−].

The selected thickness is displayed in the corresponding LED:

<table>
<thead>
<tr>
<th>Thickness (µm)</th>
<th>LED Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>5</td>
</tr>
<tr>
<td>10</td>
<td>10</td>
</tr>
<tr>
<td>30</td>
<td>30</td>
</tr>
<tr>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>100</td>
<td>100</td>
</tr>
<tr>
<td>150</td>
<td>150</td>
</tr>
</tbody>
</table>

**Motorized trimming**

- Select ‘Continuous stroke’ in functional area A.
- Activate trimming by pressing RUN/STOP and RUN/ENABLE (located in functional area C) simultaneously or by depressing the footswitch.
- To stop trimming press RUN/STOP or RUN/ENABLE or depress the footswitch again.

Trimming thickness can be changed while trimming is in motion by pressing [+] or [−].

5.4.7 **Setting the section thickness**

- Activate sectioning mode (trim off).

<table>
<thead>
<tr>
<th>Thickness (µm)</th>
<th>LED Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>

</tr>
</tbody>
</table>

- Press [+] or [−] to select section thickness. Pressing one of these keys once makes the display in control panel 1 switch to section thickness indication (thickness value not yet being altered). Pressing [+] or [−] further starts to change the actual section thickness setting.

**Selectable section thickness settings:**

- 0 - 2 µm in 0.5-µm steps,
- 2 - 10 µm in 1-µm steps,
- 10 - 20 µm in 2-µm steps,
- 20 - 60 µm in 5-µm steps,
- 60 - 100 µm in 10-µm steps,
- 100 - 300 µm in 50-µm steps.
5.5 Daily operation of the instrument

- Select chamber temperature and, in instruments with specimen cooling, specimen temperature according to the type of specimen to be sectioned (see also chapter 6.3 ‘Reference chart for temperature settings’).
- Do not continue with step 5.5.1 before the actual chamber / (specimen) temperature corresponds to the set value. This may take several hours (e.g. when operating the instrument for the first time or when the instrument had been switched off).

Prior to operating the instrument, please read and observe the following safety instructions:

- ‘Integrated safety devices’ (Chapter 2.2).
- ‘Handling microtome knives / blades’ (Chapter 2.3.4)
- ‘Knife guard / Handwheel lock’ (Chapter 2.3.5)
- ‘Motorized sectioning’ (Chapter 2.3.6)
- ‘Defrosting / handling frozen tissue’ (Chapter 2.3.7)
- ‘Frozen instrument parts and accessories’ (Chapter 2.3.8)
- ‘Infectious / radioactive material’ (Chapter 2.3.9)

5.5.1 Freezing specimens onto specimen discs with quick-freeze shelf and stationary heat extractor

- Size the specimen.
- Apply sufficient amount of embedding medium onto ambient temperature specimen disc.
- Inside the cryochamber, place the specimen onto the disc and orient.
- Place specimen disc with specimen into one of the 10 openings in the quick-freeze shelf (see below) and freeze.

The freezing process can be sped up further by using the stationary heat extractor (1). Next to the low temperature stabilizer (2) (‘Parking station’), 3 specimen discs (3) can be placed within its pivoting range.

- Place the heat extractor (1) directly onto the specimen surface. After approx. 30 seconds the specimen is completely frozen.
5. Operation

5.5.2 Freezing specimens onto specimen discs with 90 ° prism
(Instruments w/specimen cooling only)

In instruments with specimen cooling, the 90 ° prism, which is inserted into the specimen head, is an additional option to freeze specimens at maximum temperature.

Installing the 90 ° prism

- Loosen screw (3) at specimen head.
- Insert pin (1) of prism completely into receptacle (2) in the specimen head.
  **Important:** the entire rear surface of the prism must fit tightly against the specimen head surface!
- Retighten screw (3) at specimen head.

The prism now forms a horizontal surface for quick specimen freezing.

Freezing specimens with the 90 ° prism

- Apply sufficient amount of embedding medium onto ambient temperature specimen disc, add specimen and orient.
- Insert specimen disc with specimen into the receptacle (4) of the prism.
- Press \[ \text{[button]} \] to activate menu item ‘Fast Object Freezing’ and activate function by pressing \[ \text{[button]} \]
  (see chapter 5.3.4 ‘Menu functions’ item 4).

The specimen head is now automatically cooled down to the lowest temperature (-50 °C).
- Once the specimen is frozen, remove the disc from the prism and store it in the quick-freeze shelf until inserting it into the specimen head.
- Press \[ \text{[button]} \] again to activate menu item ‘Fast Object Freezing’ and deactivate the function by pressing \[ \text{[button]} \] once again (see chapter 5.3.4 ‘Menu functions’ item 4).

The specimen head temperature now automatically returns to the previously selected set value.
- Loosen screw (3) at specimen head and remove prism (1).
- Store prism inside the cryochamber.

5.5.3 Optional accessories for freezing specimens onto specimen discs and for removing frozen specimens

Mobile heat extractor

In addition to the stationary heat extractor (part of standard delivery), a mobile heat extractor is available as an optional accessory - see Appendix ‘Ordering information - accessories’:

- Store heat extractor in chamber to precool.
- Place onto specimen in quick-freeze shelf.
- Remove as soon as specimen is frozen.
**Thermoblock**

The thermoblock makes it easy to remove frozen specimens from the specimen discs.

*Do not store the thermoblock inside the cryochamber - store at room temperature and only place into the chamber for removing specimens from discs.*

- Place cap (9) on one of the two ends so that the correct size opening (7) for the disc to be inserted is exposed.
- Insert pin (6) of specimen disc (5) into the opening (7).
- After about 20 seconds remove the frozen specimen from the specimen disc (use tweezers).
- If cap (9) fits too loosely, readjust with screw (10). Do not tighten screw too much!
- Once the specimen has been detached from the disc, remove the thermoblock from the cryochamber.

**5.5.4 Inserting specimen discs into the specimen head**

- Lock handwheel in upper position.

*If a knife has already been inserted into the knife holder, cover knife edge with knife guard!*

- Loosen clamping screw (3).
- Insert specimen disc in opening (2) (rear surface of specimen disc must fit tightly against surface of specimen head).
- Tighten clamping screw (3).

**5.5.5 Specimen orientation**

- Open clamping lever (4) --> (4a).
- Orient specimen via orienting screws (1) and (5).
- Retighten clamping lever (4).
5. Operation

5.5.6 Trimming / sectioning

Inserting the knife

- Insert the knife / disposable blade into the knife holder.
- Select appropriate clearance angle at knife holder (settings between 4° and 6° are suitable for the majority of applications).

> For details on how to insert and adjust the knives, please refer to the separate instruction manual(s) for your knife holder(s). See also chapter 2.2 ‘Integrated safety devices’ incl. subchapter 2.2.4 ‘Knife guard’.

Manual trimming

- Adjust knife / knife holder relative to specimen (see ‘Knife holder’ instruction manual).
- Unlock handwheel.
- Use motorized coarse feed to bring specimen close to knife (see chapter 5.4.5 ‘Coarse feed functions’).
- Select desired section thickness (see chapter 5.4.7 ‘Setting the section thickness’).
- Move anti-roll plate away from knife.
- Rotate handwheel to trim specimen down to desired sectioning plane.

Motorized trimming

- Adjust knife / knife holder relative to specimen (see ‘Knife holder’ instruction manual).
- Unlock handwheel.
- Center handwheel grip (See chapter 2.2.2).

- Use motorized coarse feed to bring specimen close to knife (see chapter 5.4.5 ‘Coarse feed functions’).
- Move anti-roll plate away from knife.

--> Next steps: see chapter 5.4.6 ‘Trimming’.

Sectioning

- Adjust knife / knife holder relative to specimen (see ‘Knife holder’ instruction manual).
- Place anti-roll guide onto knife.
- Orient specimen, if necessary (see chapter 5.5.5 ‘Specimen orientation’).
- Select desired section thickness (see chapter 5.4.7 ‘Setting the section thickness’).
- Start sectioning at approx. 20 μm, reduce section thickness gradually until reaching the appropriate thickness for the type of specimen to be sectioned.
- Discard the first 2 to 3 sections cut at the desired section thickness.

When sectioning manually, rotate the handwheel evenly and at uniform speed.

For all details on motorized sectioning, please refer to chapters 5.4.1 to 5.4.4:

For advice on appropriate Sectioning temperatures for different types of tissue, please refer to chapter 6.3 ‘Reference chart for temperature settings’.
5.6 Finishing work

5.6.1 Daily routine steps

Remove all specimens from the cryochamber and store safely! See also corresponding safety instructions in chapter 2.3.7 ‘Defrosting / handling frozen tissue’!

- Lock handwheel.
- Remove knife from knife holder, disinfect, dry (see chapter 7 ‘Disinfection, cleaning and maintenance’) and store in the knife case.
- Use a cold brush to sweep frozen sectioning waste into the section waste tray.
- Empty section waste tray (dispose of sectioning waste according to the applicable regulations on disposal of special category waste!).
- If necessary, carry out a complete disinfection procedure (see chapter 7 ‘Disinfection, cleaning and maintenance’).
- Remove all specimens from the chamber and store safely.
- Close sliding window.
- Switch off cryochamber illumination.
- Use lock/unlock key to lock display in control panel 1 (Display background dark = locked):

```
  C T . . . ° C  O T . . . ° C
  1 2 : 0 0
```

Do not switch off mains switch / automatic cutout (see chapter 5.2 ‘Switching on / fuses’)!

5.6.2 Switching off the instrument for a longer period of time

If you do not plan to use the instrument for an extended period of time, it can be switched off. However, since this involves a lot of work (see below), it should be considered carefully whether switching off the instrument is really the better option.

If the instrument is switched off, the microtome must be removed. Then the microtome, cryochamber and all accessories must be disinfected and dried!

- For that purpose, follow the instructions in chapters 7.1 through 7.5.3.
5. Operation

5.7 Defrosting

The Leica CM3050 S has 3 (instruments without specimen cooling: 2) different defrosting options.

- Automatic chamber defrost cycle
- Manual chamber defrost cycle
- Specimen head defrosting (manual) - instruments with specimen cooling only.

> ! Read the safety instructions in chapter 2.3.7 ‘Defrosting / frozen specimens’!
> Make sure to remove sensitive specimens from the cryochamber before the defrost cycle starts!

5.7.1 Automatic chamber defrost cycle

The automatic defrost cycle is carried out once every 24 hours at the preselected time.
(For details see chapter 5.3.4 ‘Menu functions’ - items 6 and 7).

During the defrost cycle, the corresponding asterisk is displayed inversely:

```
CT - 30 °C
HOMEST TEMP  OT - 35 °C
```

Once the defrost cycle is finished, the instrument automatically switches back to refrigeration.

**Instruments with specimen cooling:**

When defrosting starts, to avoid icing the specimen head is automatically adjusted to a temperature between -10 °C and -5 °C, i.e. the set temperature value is deactivated temporarily.

The specimen head refrigeration is automatically switched back on when:
- at least 4 hours have passed since the defrost cycle was completed;
- and the actual chamber temperature deviates less than 5 K from set value.

After the specimen head refrigeration has been switched back on, the specimen head temperature rises briefly to +10 °C and then decreases until it reaches the set value.

**Switching specimen cooling back on immediately after defrosting:**

As soon as the chamber defrost cycle is completed, specimen cooling can be switched back on immediately:

- Press until menu item ‘Set specimen temperature’ is displayed:

```
SET TEMP  OT - 35 °C
```

- Press

```
SET TEMP  OT - 35 °C

```

Specimen cooling is switched back on.

> ! Despite the possibility of switching the specimen cooling system back on immediately after the automatic chamber defrost cycle, we recommend the automatic defrost cycle be set at a point in time when the entire procedure can be controlled automatically.

(See also information on menu items 6 and 7 in chapter 5.3.4 ‘Menu functions’).
5.7.2 Manual chamber defrost cycle

In addition to the automatic defrost cycle, a manual chamber defrost cycle can be activated when necessary.

- Press \( \circ \) until menu item ‘Set chamber temperature’ is displayed:

```
SET TEMP CT - 30 °C
```

- Press \( \)\. A brief sound signals that the manual chamber defrost cycle has started:

```
SET TEMP CT - 30 °C
```

The manual defrost cycle ends either when the selected defrost cycle duration is over or when a chamber temperature of -5 °C is reached.

To abort the manual defrost cycle:

- Go back to menu item ‘Set chamber temperature’ and press \( \)\. again.

**Instruments with specimen cooling:**

When defrosting starts, to avoid icing the specimen head is automatically adjusted to a temperature between -10 °C and -5 °C, i.e. the set temperature value is deactivated temporarily. (same as with automatic defrost cycle - see chapter 5.7.1 ‘Automatic chamber defrost cycle’)

10 seconds after the manual chamber defrost cycle has been completed, the specimen head refrigeration is switched back on, cooling down to the set value.

5.7.3 Defrosting the specimen head (instruments with specimen cooling only)

To activate specimen head defrosting:

- Press \( \circ \) until menu item ‘Set specimen temperature’ is displayed:

```
SET TEMP OT - 35 °C
```

- Press \( \)\. A brief sound signals that the manual chamber defrost cycle has started:

```
SET TEMP OT - 35 °C
```

Specimen head temperature increases to between +20 °C and +30 °C for a duration of 10 minutes, after which it returns to the set value.

To abort specimen head defrosting:

- Press \( \circ \) until menu item ‘Set specimen temperature’ is displayed and press \( \)\. once more.
6. Troubleshooting, applications tips

6.1 Displayed error messages

The autodiagnosis function of the CM3050 S displays error messages in case of certain malfunctions.

1. Power failure

This error message is displayed after the instrument had been disconnected from mains, either due to power failure or because the mains switch had been turned off.

```
CT - 30 °C  OT - 35 °C

POWER FAILURE
```

- To acknowledge the message, press \( \mathcal{Q} \) for about 5 seconds.

2. Coarse feed

Coarse feed malfunction has occurred.

```
CT - 30 °C  OT - 35 °C

</table>

**Please note:** The recommended temperature settings are based on long-term experience. However, they can only be guidelines for general orientation, as each individual specimen may require particular adjustments.
7. Disinfection, cleaning and maintenance

7.1 Safety instructions on disinfection and cleaning

When disinfecting the instrument, make sure to observe the following safety instructions:

- ‘Disinfection and Cleaning’ (Chapter 2.3.10)
- ‘Handling microtome knives / blades’ (Chapter 2.3.4)
- ‘Defrosting / handling frozen tissue’ (Chapter 2.3.7)
- ‘Frozen instrument parts and accessories’ (Chapter 2.3.8)
- ‘Infectious / radioactive material’ (Chapter 2.3.9)

7.2 Spray disinfection with Leica Cryofect

For practical spray disinfection, we recommend Leica Cryofect which is fully effective at temperatures in the negative range down to -20 °C.

- Set chamber temperature -20 °C or warmer.
- Remove specimens from the chamber and store safely.
- Carefully remove knife / blade from knife holder.
- Remove section waste tray from cryochamber and empty.
- Remove remaining section waste from cryochamber.
- Working accessories (brushes, specimen holders etc.) can be disinfected inside the cryochamber.
- Once the selected chamber temperature has been reached, spray Leica Cryofect on the surfaces and accessories to be disinfected.
- Allow to soak for 15 minutes.
- Use paper towels or another type of disposable cleaning cloths to wipe up disinfectant and remaining section waste.
- Dispose of paper towels together with section waste.
- If previously altered, set chamber temperature back to its former value.
- Put specimens back into the cryochamber.
7.3 Disinfection with conventional disinfectants

- Switch the instrument off.
- Carefully remove knife / blade as well as specimens and accessories from the chamber.
- Remove section waste from the chamber and dispose of it.
- Remove sliding window (see chapter 7.6 ‘Exchanging the fluorescent light lamp’).
- Remove microtome (see chapter 7.5.1 ‘Removing the microtome’).
- Allow the microtome to thaw, disinfect and allow to dry thoroughly.

Drying the microtome:

- Use a hairdryer: dry and before reinstalling into the chamber allow the microtome to cool down to room temperature.
- Allow to dry at room temperature (at least over night - longer, if necessary).

- Disinfect and dry disassembled parts (accessories and tools).
- Disinfect chamber walls with commercial alcohol disinfectant.
- Place an adequate container underneath the drain tube at the right side of the instrument.
- Pull stopper out of chamber bottom and drain off disinfecting solution into the container.
- Put stopper back into drain in cryochamber.

- Allow cryochamber to dry thoroughly.
- Reinstall microtome (see chapter 7.5.3).
- Only when they are completely dry, reinsert the disinfected accessories / tools into the cryochamber.
- Reinsert the sliding window.
- Switch the instrument back on.
- Once a suitable chamber temperature has been reached, return the specimens to the cryochamber.

7.4 Cleaning

- When necessary, the instrument surfaces can be cleaned with mild commercial household cleaners.

Surfaces which are potentially contaminated (infectious germs) should always be cleaned with alcohol disinfectants!
7. Disinfection, cleaning and maintenance

7.5 Removing / reinstalling the microtome

7.5.1 Removing the microtome

When removing the microtome make sure to observe the following safety instructions:

- ‘Removing / reinstalling the microtome’ (Chapter 2.3.11)
- ‘Defrosting / handling frozen tissue’ (Chapter 2.3.7)
- ‘Infectious / radioactive material’ (Chapter 2.3.9)
- ‘Disinfection and cleaning’ (Chapter 2.3.10)

- Prior to removing the microtome, carry out preparation steps as per chapter 7.3 (switch instrument off, remove accessories etc.)

7.5.2 Disassembling the specimen head (instruments w/specimen cooling only)

- Use Allen key size 5 to remove screw (2) from the center of the specimen head (1).

- Do not twist the refrigerating tube (see chapter 2.3.11 ‘Removing / reinstalling the microtome’).
- Hold hook (4) (part of standard delivery) in one of your hands and with your other hand rest refrigerating tube (3) on hook.
- Insert hook (4) with refrigerating tube (3) into the opening above mark (▼).
• Remove plug of temperature sensor (7).
• Remove plug of coarse feed motor:
Pull bushing backward (arrow 1) and hold.
Place your thumb between plug (6) and socket at the microtome (arrow 2).
To remove plug (6) from microtome, pull it away from the microtome while at the same
time carrying out a slight jogging movement (arrows 3).

7.5.3 Reinstalling the microtome

When reinstalling the microtome make sure to observe the following safety instructions:

• ‘Removing / reinstalling the microtome’
  (Chapter 2.3.11)
• Display message ‘Dry Microtome’
  (Chapter 2.3.12)

• Lock handwheel in lower position.
• Place microtome in chamber.
• Put one drop of cryostat oil per surface on the contact surfaces of plastic coupling (11)
  and handwheel coupling (12).
• Place plastic coupling (11) on handwheel coupling (12).
• Push microtome slightly towards the right until axle (9) fits tightly into coupling (11).
• Unlock handwheel.
• Adjust the parts into each other by rotating the handwheel slightly backward and forth.
• Lock handwheel again in lower position.
• Tighten screws (8).
• Reconnect plugs of coarse feed motor (6) and temperature sensor (7).
• Mount specimen head (in reverse order as described on previous page).
• Insert accessories (storage shelf, section waste tray etc.).
• Insert sliding window.
• Connect instrument to mains and switch back on.
7. Disinfection, cleaning and maintenance

7.6 Exchanging the fluorescent light lamp

Prior to exchanging the lamp, please read and observe the following safety instructions:

- ‘Maintenance’ (Chapter 2.3.13)

Removing the sliding window

- Hold sliding window (1) at grip bar (2), lift slightly and pull out towards yourself.

Installing the replacement lamp

- Hold the lamp in correct position (see drawing below) and push towards the right until it locks into the socket.
- Push the lamp slightly upwards until it locks into the clip.
- Put the sliding window back in place.
- Reconnect the instrument to mains and switch it back on.
8. Warranty

8.1 Warranty

Leica Microsystems Nussloch GmbH guarantees that the delivered product was subjected to stringent quality control to ensure that the instrument complies with its technical specification.
The warranty conditions of your local Leica sales company or dealer apply.
Only authorized Leica technical service engineers may carry out repairs on the instrument.
Any intervention on / modification of the instrument and any use of accessories other than those delivered by Leica is subject to prior approval by Leica, unless explicitly specified otherwise in this manual.
Please note that any spare parts and accessories, which are not supplied by Leica, have neither been inspected nor have they been approved by Leica.
Therefore, installation or use of such parts and/or accessories may impair the design features of the instrument.

Leica assumes no liability for any damage caused by the use of non-original spare parts or non-original accessories.

Warranty claims can be made only if the instrument has been operated according to its designated use and according to the instructions given in this manual.
Damage resulting from improper use of the product and/or faulty operation invalidates the warranty.
Leica will not assume liability for any such damage.

8.2 Technical service information

If you require technical service or need replacement parts, please contact your Leica sales representative or dealer who sold the product.
Please provide the following information:
• Model name and serial number of the instrument;
• Location of the instrument and name of the person to contact;
• Reason for the service call;
• Delivery date of the instrument.
If not accompanied by an official return authorization form, Leica Microsystems Nussloch GmbH does not accept any returned merchandise.
8. Warranty and service

8.2.1 Important information for repairs / returns of cryostats

If there is any risk that the instrument or parts of it are contaminated with infectious or radioactive substances, the customer must disinfect / decontaminate the instrument prior to returning it or to having it repaired on-site.

The customer must expressly confirm disinfection / decontamination, indicating as well the disinfection / decontamination method used.

a. On-site repairs:
   Leica Technical Service personnel is instructed to ask for proof of disinfection / decontamination and the method(s) that has/have been used.

b. Returned instruments:
   Written statement confirming disinfection / decontamination and method(s) applied to be included in shipment!

   
   | If instruments / parts for repair arrive at the Leica facility in a state which suggests that the instrument has not been properly disinfect ed / decontaminated, the instrument(s) / part(s) will be returned to the customer, at the customer’s expense! |

8.3 Shutdown and disposal of the instrument

The instrument or parts of the instrument must be disposed of in compliance with the local laws.

The Leica CM3050 S contains a large number of recyclable components. For more information on the recycling program for our cryostats, please contact your Leica sales representative or dealer, or Leica Microsystems Nussloch GmbH, Germany.

We will be glad to provide you with details on the recycling concept for our cryostats which meets today’s environmental requirements.
1. Electrohydraulic height adjustment

An electrohydraulic lifting device for individual working height adjustment is available as an optional accessory for the CM3050 S cryostat series.

1.1 Designated use

The electrohydraulic height adjustment device has been designed exclusively for adjustment of the instrument working level to the individual height of the user.
It has been designed for use with the Leica cryostat series CM3050 S only and may under no circumstances be used to lift other instruments or persons.
Damage resulting from improper use of the product and/or faulty operation invalidates the warranty.
Leica will not assume liability for any such damage.

1.2 Standard delivery

Electrohydraulic height adjustment device for cryostat series CM3050 S, complete outfit, consisting of a U-shaped frame on four height-adjustable feet and a two-key control unit.

The height adjustment device is available in 2 voltages:

1. 230 – 240 V / 50 Hz – order no. 0443 26147
2. 230 – 240 V / 50 Hz – order no. 0443 26147

1.3 Safety instructions

Prior to operating the height adjustment device, make sure to read the present instruction manual. Pay special attention to the following safety instructions:

Prior to connecting the height adjustment device to mains, check to make sure that the nominal voltage and frequency indications on the device name plate correspond to the actual mains voltage in your lab!

Do not move the height adjustment device with the Leica CM3050 S installed on the frame. If the place of installation needs to be changed, first take the Leica CM3050 S down from the height adjustment device and then move both devices separately.

Never place your feet underneath the U-frame when lowering the height adjustment device! Risk of injury!

Only authorized Leica technical service engineers may carry out repairs on both the Leica CM3050 S and the height adjustment device. This applies especially to all work carried out on the hydraulic system of the height adjustment device.
1.4 Installation

- Open the shipping box and remove all packing material including the Styrofoam pieces.
- Take the height adjustment device out of the box.
- At the place of installation, place the U-frame on the floor with the open side facing yourself. Adjust the U-frame parallel to the wall, maintaining a distance of approx. 10 cm between wall and U-frame.
- Push the (ab) button to lower the height adjustment device to the lowest possible position.

- In order to be able to move the instrument, use a fork wrench and unscrew the rollers on which the Leica CM3050 S moves by about 2 cm.

- Roll the cryostat onto the U-frame as far as it will go. The rear of the cryostat housing has to fit closely to the rear bar of the U-frame.

- Roll the cryostat onto the U-frame as far as it will go. The rear of the cryostat housing has to fit closely to the rear bar of the U-frame.

- Plug the height adjustment device into the mains socket. The unit is now ready for use.

When placing the instrument onto the U-frame, make sure the power cord does not get caught and thus crushed between U-frame and cryostat housing.
1.5 Control keys

The control keys are located on top of the control unit (see photograph).

- To lift the instrument, press ▲.
- To lower the instrument, press ▼.

As long as a button is held, the instrument will go up or down until reaching the upper or lower limit.

1.6 Maintenance and care

- Protect the lifting pistons in the four legs of the height adjustment device against dust and water.
- Approximately every six months lubricate the legs with a thin coat of resin-free oil.
- Once every year have the height adjustment device checked by an authorized Leica service engineer.

1.7 Troubleshooting

1. Slight and uniform loss of height of the device in the course of several weeks is normal. Remedy:
   Correct the loss of height by pressing the ▲ button until the instrument is lifted back up to the desired working level.

2. The cryostat is in an inclined position due to an uneven upward movement of the lifting pistons. Difference of level among the four legs > 5 mm.
   Remedy:
   Have the instrument travel once up and down over the entire height adjustment distance: press ▲ until the instrument reaches the upper limit position and then ▼ until the instrument reaches the lowest possible position. Then lift the instrument back to regular working height. Should the problem re-occur several times, call Leica Technical Service.

3. The height adjustment device does not reach the maximum upper level or the instrument lowers itself by a relatively large distance (> 5 cm) within a short time.

EC Declaration of Conformity

We herewith declare, in exclusive responsibility, that the

Cryostat- Microtome Type CM3050 S

was developed, designed and manufactured to conform with the
Council Directive 73/23/EEC (Low Voltage), and
including their amendments up to the date mentioned below.

The following harmonized standards were applied:

DIN EN 292,
DIN EN 61010-1,
EN 50082-1,
EN 55011
IEC 1000-4

The following national standards, guidelines and specifications were applied:

MedGV

In addition, the following in-house standards were applied:

DIN EN 9001

A complete set of technical documentation is available.
An instruction manual for subject product is available.
